

Sail away with the help of JCB!

Did you know that JCB Teletruks are used to load and unload cruise ships? They are perfect for this job because they have unique 'power down' hydraulics which allows them to lift or unload heavy objects which are lower down than they are. This means they can operate at low tide when the door of the ship is lower than the quayside. Other machines can't do this and have to wait many hours until the sea rises. JCB Teletruks can get on with the job straight away and help the cruise ship stay on schedule.

For more information about JCB machines, visit the Info section on JCBexplore.com
